Numbase Group | Project 1: Creative Model-Switcher Interface

1. Welcome to the Team!

We are excited to have you here. This first project isn't just a test of your coding skills, it's an invitation to explore your creativity. At Numbase, we don't just "write code"; we build experiences.

Your goal is to create a professional AI chat interface that looks and feels like a premium product. Don't worry if you don't have professional experience yet; we want to see how you use the latest AI tools to build something better than a "standard" chat app.

2. The Creative Challenge

Forget the basic "blue bubble" chat apps you see everywhere. We want you to focus on **Creative UI/UX**.

- **Fluid Motion:** Think about how messages appear. Do they slide? Do they fade? How does the "typing indicator" look?
- **Model Identity:** Can you make the UI change subtly when I switch between GPT-4 and Gemini? (e.g., a color shift or a different glow).

3. Tool-Agnostic Philosophy

We don't force you to use a specific programming language. Whether you love **JavaScript (React/Next.js)**, **Python (Streamlit/FastAPI)**, or any other stack, the choice is yours.

What matters is the result: A unified system where the frontend stays clean while the backend handles the "heavy lifting" of talking to different AIs.

4. Leveraging AI to Build

As a modern developer, **you should work *with* AI, not against it**. Use these tools to elevate your work:

- **For Design:** you can use Google Stitch or v0.dev to generate high-fidelity UI layouts from a simple prompt, or use any ai of your preferences.
- **For Research:** Use **Gemini** or any other LLM you prefer to find the best CSS libraries for animations (like Framer Motion or GSAP).

- **For Logic:** Use LLMs to help you write the "Provider Abstraction Layer", the part of the code that makes sure your app works the same whether it's using Gemini or GPT-4.

5. Functional Requirements (The Core)

5.1 The Interface

- **Creative Bubbles:** Distinguish between User and AI with more than just alignment. Use icons, distinct shapes, or unique typography.
- **Model Switcher:** A prominent, stylish selector. **Crucial:** Once a chat starts, lock the model or show a creative warning before switching.
- **Empty State:** Design a beautiful "Welcome" screen. Don't leave it blank give it personality!

5.2 The Memory & Sidebar

- **History:** A sidebar that saves your past chats. These must stay there even if I refresh the page.
- **Context:** Make sure the AI "remembers" what was said 3 messages ago.

6.Your Success Roadmap (Here are some tips)

Step 1: Moodboarding with AI

Ask Gemini: *"Show me 5 creative, modern UI concepts for an AI chat interface that use Glassmorphism."* Pick a style that excites you.

Step 2: The "Contract"

Before you code, decide how your data will look.

- *Example:* Every response from your backend should look exactly the same: `{ "author": "assistant", "text": "Hello!" }`. This is called **Normalization**.

Step 3: Security First

The Golden Rule: Never put your API keys in your code. Use a `.env` file. If we see a key on GitHub, it's a security breach!

Tip: Start small. Get one "message" to appear on a beautiful screen first. The rest will follow!
GOOD LUCK!
